AUTHORS :

Czarnecki, Jerzy; Wykpisz, Antoni

TITLE:

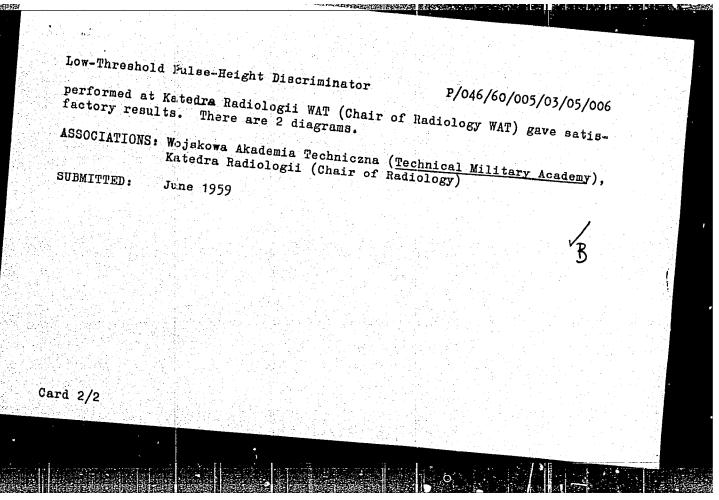

Low-Threshold Pulse-Height Discriminator

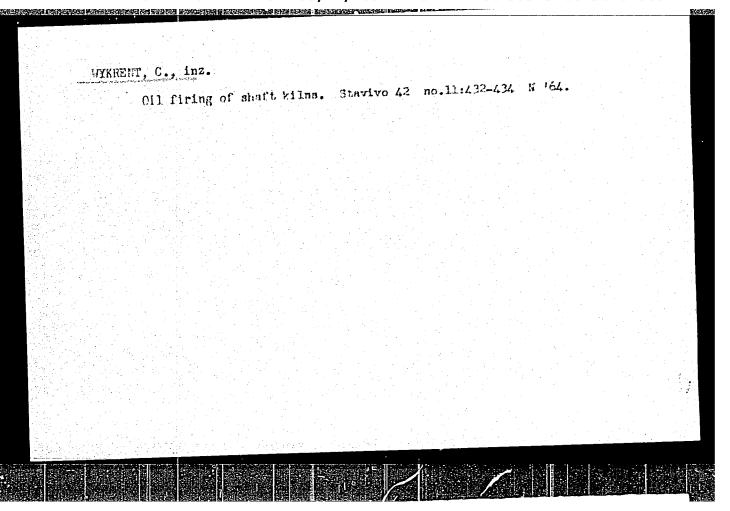

PERIODICAL:

Nukleonika, 1960, Vol. 5, No 3, pp 157 - 160

TEXT: The authors describe the simple circuit of a highly sensitive pulse-height discriminator intended for use in simple spectrum analyzers required in the identification and differentiation of radioisotopes/9 Figure 1 shows the circuit diagram of the externally excited relaxation system with two resistance-capacitance couplings. The circuit uses one duotime with two resistance-capacitance couplings. The circuit uses one duotimed and one pentode. Provided that grid and plate voltages are stabilized within 2% and the heating voltage within 10%, the discriminator opplized within a threshold range of 50-1,500 mv. Minimum threshold height erates within a threshold range of 50-1,500 mv. Minimum is determined depends on the stability of feed voltages, while the maximum is determined by the length of the linear section of the input triode characteristics. by the length of the linear section of the input triode characteristics. The discriminator operates on negative pulses, the resolving time is 10 microseconds. A photomultiplier may be directly attached to the output of microseconds. A photomultiplier may be directly attached to the output of a pulse-height analyzer using this discriminator circuit. Pertinent tests

of an Experimental Situation Upon the Course of Motor

Conditioned Reflexes.

Orig Pub : Acta biol. Exptl., 1956, 17, No 1, 189-203

Abstract : In each of six dogs, two food motor conditioned reflexes

with different motor effects were obtained. If these two reflexes were developed in one and the same or in analogous experimental situations, interchanges of the two motor reactions were observed. In the case of the rapid appearance of one of these, the other reaction appeared. If both reflexes were obtained correspondingly in two dif-

ferent situations, neither the interchange of the motor

reaction nor the appearance of one following the other could ever be noted. Each movement in this case appeared in its "correct" form (i.e., corresponding to the situation in which it was developed) even then when one and the same conditioned stimulant was used in both situations. The mechanism of this phenomenon is determined by the deciding influence of the experimental situation on the level of excitability in the centers of the movement investigated.

POLAND/Acoustics - Sound Wave and Oscillation

J-2

Abs Jour : Ref Zhur - Fizika, No 4, 1959, No 6529

Author .: Wyrzykowska Barbara

: Acoustic Impedance of Plane Generators: Rectangle, Ring, Title

Ellipse.

Orig Pub: Proc. II. conf. ultrason., 1956, Warszawa, PMN, 1957, 99-104

Abstract: To calculate the acoustic impedance of radiators, use is made of double integration of the Green's function over the surface

of the radiator

 $E = -i \frac{h}{5} SS, \frac{u_0(n')}{u_0(n)} G(r, n') dS'dS$ 

where  $\xi$  is the impedance, S the surface of the radiator,  $u_0$  the amplitude of the oscillation velocity on the surface of the radiator, while r and r' determine the positions of the two different points on the radiator.

At a constant distribution of the amplitude of the vibra-

化克勒氏 人名英格勒 医二氏管线 计分配管 tional velocity on the radiator, which represents a portion of an infinite stationary plane,  $u_0(r')/u_0(r) = 1$ . The Green's function for the wave equation in a space bounded by the plane is of the form [exp (with)]/ 2mh, where h = r -r'. The double integral is divided into a real and imaginary part, and the integrand is expressed in terms of Bessel functions. This is followed by an expansion in series, which converge rather rapidly.

Final expressions are given for the real and imaginary parts of the impedances of a rectangular and plane radiator with sides 2a and 2b, with a > b, for a ring radiator with an external radius a and an internal radius b, and for an ellipse

with axes 2a and 2b (a 2b).

It was found that the acoustic impedance of an ellipse can be represented by the acoustic impedance of a circle, inscried inside the ellipse, with the correction in the form of an infinite series. The closer the ellipse approaches a circle in shape, the more rapidly does this series converge. When : 2/3
